

ABSTRACT

A synthetic-grass structure for laying on a subfloor comprises:

- a sheet substrate with a plurality of filiform formations extending upwards from the substrate to simulate natural grass cover; and
- a particulate filling material or infill dispersed between the filiform formations in such a way as to maintain the filiform formations in a substantially upright condition.

The infill consists of a substantially homogeneous mass of a granular material chosen in the group made up of polyolefin-based materials and vinyl-polymer-based materials, preferably recycled ones.
